

Project Progress Report: SecuLogix InStock

This report documents all tasks completed from the start of the project up to this point.

Completed Work (Phase 1: Foundation)

1. Database Schema Configuration

- Analyzed the Implementation Plan PDF.
- Defined the Prisma ORM schema (prisma/schema.prisma) with all required tables (Users, Parts, Locations, Movements, etc.) using UUID primary keys.

2. Application Layout and Styling

- Configured Tailwind CSS v4 variables in globals.css with the SecuLogix dark, industrial theme palette.
- Set up custom fonts (Inter and JetBrains Mono) inside the main layout (layout.tsx).

3. Authentication

- Setup NextAuth.js (lib/auth.ts & route.ts) configured with CredentialsProvider to verify against hashed passwords stored in the database.
- Implemented the login page UI (login/page.tsx).

4. Dashboard Shell

- Built the persistent left navigation sidebar (Sidebar.tsx) displaying navigation links based on user role.
- Created the main dashboard overview page (dashboard/page.tsx) with stat widgets (Total Parts, Total Stock Units, Low Stock Alerts) and the Recent Activity timeline list.

5. Database Seeding Script

- Assessed the provided seed.ts file which parses the Excel spreadsheet (Untitled spreadsheet.xlsx) and pre-loads categories, subcategories, HSN codes, locations, and the default admin user.

Next Steps:

- Ensure the database instance is connected via the .env file.
- Run migrations and start the dev server locally.
- Proceed to Phase 2 (Core Inventory Features) which includes Parts CRUD APIs and the Multi-step Add Stock Wizard.
